Precision 28124
Quad-Channel Wideband Transducer Conditioner with Voltage and Current Excitation

28124 Quad-Channel Wideband Transducer Conditioner with Voltage and Current Excitation offers four channels of conditioning to support a wide variety of transducers including those that require constant voltage excitation or constant current excitation. Balanced constant voltage excitation in a bridge configuration supports applications such as strain gages and pressure transducers. Balanced current excitation accommodates single arm static or dynamic strain gages, RTDs or other resistive transducers. Each of three independent outputs can be programmed for filtered or wideband operation, allowing for simultaneous measurement of static and dynamic signals from one transducer.

28124 Applications
- Static or dynamic strain gage conditioner
- Full bridge conditioner
- Pressure transducer conditioner
- Piezoresistive accelerometer conditioner
- RTD conditioner
- Load cell conditioner
- MEMS transducer conditioner
- Hot wire anemometry
- AC or DC filter/amplifier (<1 mV to 10 V inputs)

Precision 28124 Features
- Four channels per card, 64 channels per 28016 chassis
- Three independent programmable wideband or filtered outputs with output ground sense to reference output to a distant grounded load
- Balanced programmable constant voltage excitation with remote sense – up to 20 V delivered to the bridge with AC shunt calibration test mode for verifying transducer, cabling and measurement system frequency response
- Balanced differential constant current excitation (20 mA/20 V compliance) with AC current test mode for verifying transducer, cabling and frequency response
- On-the-fly report of measured transducer excitation and resistance
- Transducer open/short indication
- Transducer leakage resistance measurement in constant current excitation mode
- Automatic bridge balance/transducer suppress
- Up to 100 kHz “filtered” bandwidth or 250 kHz “wide-band” bandwidth
- 2 to 10-wire plus shield bridge input interface
- 2 or 4-wire input plus shield transducer interface with constant current excitation
- Programmable AC/DC input coupling
- Programmable gain: x1/16 to x8192 with 0.01% resolution
- 4-pole low-pass filters with programmable pulse/flat characteristics
- Overload detection
- Precise digital calibration
- Programmable 5000 step (BC6 completion module) or single step (BC7 completion module) bipolar DC shunt cal
- Programmable bridge configuration: 1-arm, 2-arm or 4-arm bridges
- Programmable bridge resistance: 120 Ω, 350 Ω or 1 kΩ

28000 Analog Signal Conditioner System
The new standard for the world’s most discriminating test labs.

Overview

28000 Analog Signal Conditioning System provides all the flexibility you need to manage your test measurements. The Precision 28000 makes it easy to manage a test with hundreds of channels and a mix of transducers. Choose charge, IEPE w/TEDS, voltage (filter amplifier), strain, thermocouple, RTD, potentiometer, current, frequency, or other transducers.

The built-in test hardware and software (optional) provide quick go/no-go tests which can be run before each test, and rigorous factory acceptance tests to assure you that the 28000 meets your most stringent requirements for critical applications. It won’t be long before these tests earn a permanent place in your maintenance routine. And since they are traceable to NIST, they eliminate the need for off-site calibration.

In every phase of your tests—record keeping, installation, design, set-up, operation, maintenance and upgrading—the Precision 28000 offers ways to help you save time and money over the life of the system.

28000 System Features
- Graphical User Interface (GUI) and Ethernet network interface for system control
- Intelligent gain and system scaling algorithms
- Test input and output monitor busses
- Go/no-go test with diagnostics to be used before tests
- Rigorous factory acceptance test for maintenance
- Field swappable AC power supplies
- Built-in temperature and power supply monitoring with alarms
**Precision 28124 Description**

The 28124 is a member of the Precision 28000 family of signal conditioners. The 28124 provides four channels of conditioning for transducers requiring constant current or constant voltage excitation. Up to sixteen 28124 cards may reside in the 28000 system to provide 64 channels per chassis. In addition, the 28124 may be mixed with other conditioners in the 28000 family to meet your unique signal conditioning requirements.

Large changes in sensor impedance or sensor excitation can indicate that data from this sensor is no longer meaningful. The unique transducer health monitor circuits of the 28124 provide an “on-the-fly” report of measured sensor excitation and resistance. Measured gage resistance is compared to user specified limits and flagged if out of tolerance. Also, the 28124 alerts the user to a transducer open or short condition. The input overload detector reports overloads by out-of-band signals which could cause in-band distortion.

The 28124 features precise, automatic calibration of gain and offset for the entire channel, including the amplifier, filter, and excitation supply. Programmable bridge configuration and excitation supply are supported on all four channels of the 28124 card via the optional BC plug-on module. The BC6 or BC7 modules support programmable bridge configuration for quarter, half or full bridges and programmable completion for 120 Ω, 350 Ω or 1 kΩ bridges. The BC6 provides over 5000 steps of bipolar DC shunt calibration while the BC7 has bipolar single-step precision resistor shunt cal. Dedicated shunt cal lines are provided that allow the user to perform the shunt cal on non-current carrying leads.

**Balanced Constant Voltage Excitation**

The 28124 provides balanced constant voltage excitation of up to 20 volts and conditioning for 1-, 2-, and 4-arm resistive bridges. The 28124 features automatic calibration of gain and offset for the entire channel, including the amplifier, filter, and excitation supply. The 2- to 10-wire input connection provides 6 wires for the bridge, 3 wires for DC shunt calibration, 1 wire for the shield, and 1 wire for single-arm bridges. Automatic balance of the bridge is accomplished by inserting a voltage ratiometric with the excitation supply to the amplifier input stage. This balance method provides outstanding stability without loading the bridge. A wide range of unbalanced conditions may be accommodated.

Balanced constant voltage excitation offers a number of advantages over single-ended excitation. It enables a true balanced instrumentation amplifier input for outstanding rejection of high frequency common mode signals. Single-ended voltage excitation to balanced bridges produces a relatively large common mode voltage at half the excitation supply. The instrumentation amplifier must reject this signal. Balanced voltage excitation applied to balanced bridges results in lower common mode input voltages to the amplifier input stage.

The excitation supply has automatic amplitude and offset correction that may be run on the unit in place at any time. Dedicated remote sense lines allow the excitation supply regulator to deliver an accurate voltage to the bridge.

The 28124 provides a unique AC shunt calibration capability that allows the operator to simulate dynamic strain fluctuations on the bridge. The test bus voltage is utilized as the reference for the AC shunt calibration signal meaning the waveform type and amplitude may be uniquely defined to match waveforms expected during the actual test. In addition to verification of bridge impedance, the AC shunt calibration allows the user to examine the effects of the input cabling on the frequency response of the system.

**Balanced Constant Current Excitation**

The 28124 is equipped with Precision Filters’ proprietary balanced differential constant current excitation that is optimized for making dynamic strain measurements on single active strain gages. Balanced constant current excitation provides an accurate means of measuring dynamic strain with a single active strain gage using only a two-wire connection. Electrostatic pickup is reduced when compared to single-ended constant current excitation or a quarter bridge configuration with remote completion resistors or unbalanced current sources. The balanced current excitation circuit operates properly even under certain common gage fault conditions such as a direct short of the gage to the test model.

Balanced constant current excitation provides a true balanced input for rejection of common-mode signals. Programmable excitation provides 0 to ±20 mA of constant current with an “excitation off” mode to detect input cable noise pickup. Gage open/short detection is also provided.

For dynamic strain conditioning applications, the 28124 can provide accurate measurements with only two wires by AC coupling the input. For best AC or DC measurements (required for RTD type transducers), the 28124 provides a 4-wire Kelvin connection for remote sense. Constant current excitation may be applied to full bridge applications with the advantage that excitation delivered to the bridge is unaffected by excitation supply lead wire resistance.

Suppression of the gage DC operating point is performed automatically using the zero suppress feature of the 28124. Zero suppress allows the use of more gain to emphasize small gage fluctuations. Zero suppress also provides the user with an accurate means to balance a full bridge.

The excitation current source output may be modulated to allow AC current injection in the loop. The frequency and amplitude of the AC current is user controlled. This allows the user to simulate changes in gage resistance in the loop and provides direct AC input stimulation to the signal conditioner for end-to-end system calibration.
Input Stage
The 28124 input stage provides 120 dB of common-mode rejection and may be either AC or DC coupled. AC coupling is useful for dynamic applications where the DC bias on the transducer, that can limit dynamic range, can be coupled out of the signal. With the input DC coupled, low drift and ultra low noise (< -163 dBV/√Hz) is provided by the 28124 input stage. The input stage may be shorted under program control to verify signal conditioner channel noise and DC offsets.

A switch at the input stage is provided to connect the amplifier to the 28000 system test bus. The test bus is used to inject signals for performance verification. In addition, both drive and sink current levels may be monitored separately, making it possible to detect excitation current leakage conditions in the external current loop.

Amplifier and Filter
Programmable pre- and post-filter amplifiers provide an overall gain of 8192. Gain is distributed both before and after the filter to provide protection from large out-of-band energy or transients that could cause clipping before the filter, distorting the data. The Gain Wizard in the GUI allows the user to set a gain reserve and then apportions the gain between the input and output. This provides input gain for best noise performance yet conforms to the limitations of the user’s worst case estimate of out-band or transient signals. Overload detectors alert the user to over-voltage conditions.

A fully buffered output having over 25 mA of drive capability may be used to drive long output cable runs.

The 28124 is specified with a 4-pole low-pass filter with cutoffs programmable from 1 Hz to 100 kHz and programmable “flat” or “pulse” mode. The “flat” mode provides pass-band characteristics nearly identical to a Butterworth filter while providing a much sharper roll-off. This mode is a good choice for applications such as spectral analysis. The “pulse” mode has time domain response similar to the Bessel filter yet provides superior amplitude response characteristics. The “pulse” mode is ideal for time domain applications including transient (shock) measurements and time domain waveform analysis.

Output Stage
The 28124 has three independently buffered outputs. A single-ended rear panel output is intended to drive the primary data acquisition hardware. Two sets of auxiliary outputs are available on the front panel of the card. All three outputs have ground sensing circuitry that breaks ground loops when connecting grounded loads. The sensing circuitry also corrects the output for any potential differences between the 28124 ground and the load ground.

Each of the three outputs may be selected for filtered or wideband operation under program control. This allows the 28124 to measure both AC (dynamic) and DC (static) signals coming from one transducer.
**Verification of Cables and Sensor Health:**

**Strain Gage Loop Resistance Measurement:** Dynamic strain measurements often require complicated wiring schemes. Long cable runs, multiple connection points, high-temperature high-impedance very small diameter wire and slip rings combine to cause uncertainty in the strain gage connection. Often a sudden increase in gage resistance is a predictor of gage failure. The Precision 28124 gives continuous real time monitoring of the total “Loop Resistance” of the gage and cable circuit. This loop resistance reading can be compared to preset limits to alert the user of unexpected resistance shifts as well as gross gage short and gage open conditions.

**Cable Roll-off:** One often asked question of many measurements engineers is “How will my cable capacitance affect my high frequency strain measurement?” This question can be answered quickly and easily and all from the convenience of the control room. The AC dither current feature of the 28124, in balanced constant current excitation mode, modulates a small AC current on top of the DC excitation current to simulate an AC signal across the actual strain gage sensing element. In balanced constant voltage excitation mode, the AC shunt calibration feature allows the operator to inject an AC current into a bridge corner to stimulate actual gage fluctuations.

Since the stimulus signal is based at the sensor, it will exhibit the same roll-off characteristics as a signal resulting from actual dynamic strain. The test frequency of the AC signal can be increased as necessary to chart the cable roll-off characteristics and validate the cable circuit for use at the desired measurement frequencies.

**Gage Leakage Measurements:** In extremely hot sections of a gas turbine engine, it is impossible to use standard insulating materials in gage wiring. Often a rigid section of a stainless steel or Inconel sheath encloses high temperature inner conductor wires. The inner core of the sheath is filled with magnesium oxide (MGO) as a high temperature insulating material. The insulating properties of the MGO are affected by moisture absorption at damage points or improperly sealed cable terminations. In extreme conditions, insulation breakdown can cause a leakage path to ground and corrupt a gage reading. Other causes of cable leakage are fatigue or failure at extension wire tie-down points, or in the strain gage itself. The leakage detection feature of the 28124 continually monitors leakage and compares readings to preset threshold limits. Sensors which show higher than normal leakage can be quickly identified prior to or during the test run.

**Muting Faulty Sensors:**

Depending on the sensor type, various techniques must be used to quiet the channel’s input and output circuits and ensure that no noise coupling occurs. For example, an intermittent gage will create a gage chatter condition whereby the connecting wires continually switch between the high voltage fault level and the proper low voltage operational level. This chatter condition creates a hostile noise source to any other gage extension wires in the vicinity of the hostile cable. Precision 28124 signal conditioning channels have a “MUTE” feature, which places the channel in its quietest quiescent state and minimizes the possibility of coupling noise to properly functioning channels.

**28124 Programmed Features**

- **Constant voltage excitation level:** 0 to 20.475 V in 5 mV steps
- **Constant current excitation level:** 0 to 20.475 mA in 5 µA steps
- **Expected transducer resistance and tolerance**
- **Transducer leakage resistance thresholds**
- **Voltage excitation sense:** instrument or gage
- **Current excitation input interface:** 2-wire or 4-wire
- **Bridge configuration:** 1-arm (2-wire), 1-arm (3-wire), 2-arm or 4-arm
- **Bridge resistance:** 120 Ω, 350 Ω or 1 kΩ
- **DC shunt cal:** instrument or gage
- **DC shunt cal resistance and shunt arm:** R1 or R2
- **Automatic balance/suppress**
- **AC/DC input coupling**
- **Test modes:** amp short, 10 V DC CAL, excitation off, test bus (voltage substitution), DC shunt calibration, AC shunt calibration, AC current, excitation monitor
- **Output monitor**
- **Gain:** x1/16 to x8192 with 0.01% resolution
- **Filter type:** pulse or flat
- **Cutoff frequency:** 2 Hz to 100 kHz, flat mode
- **Wide-band (250 kHz) or filtered operation**

**28124 Graphical User Interface Display**

All programmable features in addition to:

- On-the-fly excitation monitor
- On-the-fly sensor resistance monitor with pass/fail status
- Sensor open or short indication
- Configuration read back
- Balance/Suppress status
- Input wiring
- Transducer sensitivity
- System scaling in engineering units
- Overload status
- Intelligent gain algorithm
- Group control
28124 Details and Specifications

28124 Conditioner Cards
The detailed description and specifications for the 28124 are organized as follows in the sections below:

- Programmable Bridge Configuration Modules
- Bridge Wiring
- Excitation Supply
- Input Characteristics
- Amplifier Characteristics
- Test Modes
- Filter Type Characteristics
- Output Characteristics
- General Characteristics
- Accessories
- Ordering Information

Programmable Bridge Configuration Modules

Constant Voltage Excitation Mode:
The optional BC plug-on bridge configuration modules provide support for programmable bridge configuration. In addition, the BC6 and BC7 modules support programmable DC shunt calibration for all four channels on the 28124 card when using constant voltage excitation. The BC8 module provides conditioning for modulated current output transducers, such as those with 4-20mA outputs.

All completion modules may be programmed to support 1-arm, 2-arm or 4-arm (quarter, half or full) bridge configurations. Completion resistance is programmable for 120Ω, 350Ω or 1kΩ. Completion resistors are metal foil technology and are very precise and very stable.

The BC6 DC shunt calibration utilizes voltage insertion at the bridge, providing over 5000 steps of single shunt calibration of bridge arms R1 or R2. The user may program the shunt to be applied at the gage (if additional cable wires are used) or at the instrument. Shunt sensitivity is set by a precision resistor on the BC6 card and is programmable from 125μV per V of programmed excitation to ±16 mV/V in 0.2% resolution. The effective range of shunt resistor values is 30.75 to 2000 times the bridge programmed bridge resistance. The BC6 shunt calibration may only be used in conjunction with constant voltage excitation.

The BC7 provides traditional single-step bipolar shunt cal using a precision resistor. Single shunt of either R1 or R2 bridge arms may be selected. The standard BC7 shunt cal produces 1 mV/V single shunt. Consult factory if custom shunt resistor values are required.

The BC8 supports 2-wire or 4-wire connections to modulated current output devices that require a constant voltage power supply to excite them and provide a current output proportional to the measurement units. This includes sensors with 4-20mA outputs. The BC8 switches a 250 ohm resistor across the amplifier input to measure the sensor current output.

The BC9 completion module supports programmable bridge completion only.

Constant Current Excitation Mode:
When using constant current excitation, the bridge configuration modules provide programmable configuration of 2-wire or 4-wire input mode. 2-wire mode is useful for dynamic strain measurements where the input stage of the amplifier is AC coupled. The 4-wire mode may be used to make static measurements with a Kelvin connection to the gage. The 28124 zero suppress circuit can be used to zero the transducer bias when operating in the 4-wire configuration. The wide range of the zero-suppress circuit can accommodate large transducer bias voltages.

Bridge Configuration Module Specifications:

Completion Resistors:
120Ω, 350Ω and 1kΩ, programmable

Bridge Configuration:
1-arm, 1-arm w/ 3 wires, 2-arm or 4-arm, (programmable)

Resistor Temperature Coefficient:
±0.2 ppm / °C

Resistor Accuracy:
±0.02%

BC6 DC Shunt Calibration
(Constant Voltage Excitation Mode Only):

DC Shunt Selection:
R1 or R2 bridge arms

Equivalent Shunt Resistance Settings:
30.75R to 2000R with 0.2% minimum resolution where R = 120Ω or 350Ω or 1kΩ

Shunt Sensitivity:

- ±0.125 mV/V to ±0.5 mV/V in ±0.25 μV/V steps
- ±0.501 mV/V to ±2.0 mV/V in ±1.00 μV/V steps
- ±2.004 mV/V to ±8.0 mV/V in ±4.00 μV/V steps

Shunt Accuracy:
±0.2% for programmed excitation >1 V

BC7 DC Shunt Calibration:

DC Shunt Selection:
R1 or R2 bridge arms

Sense Resistor:
29.940 kΩ for 120Ω bridge
87.325 kΩ for 350Ω bridge
249.5 kΩ for 1kΩ bridge

Resistor Accuracy:
±0.1%

BC8 Current Sense:

Modes:
2-wire sense or 4-wire sense

Sense Resistor:
250 ohms ±0.1%

Bridge Wiring:

Input Connector:
26-pin high-density D-shell (2 ea.)

Input Wires:
±EXCITATION (2)
±SENSE (2)
±SIGNAL (2)
SHUNT CAL (3)
¼ Bridge RTN (1) Single Arm Bridge
SHIELD (1)

## 28124 Details and Specifications

### 28124 Excitation Supply
**Programmable Constant Voltage Excitation**
- **Maximum Output:** 20.475 V, 30 mA (balanced)
- **Steps:** Programmable from 0 to 20.475 in 5 mA steps
- **Excitation Sense:** Programmable (instrument or gage sense)
- **Accuracy:** ±0.03%, ±500 µV
- **Noise:** 100 µVrms, 3 Hz to 200 kHz
- **Temperature Drift:** ±0.0025%/°C of setting or ±50 µV/°C, whichever is greater
- **Sense Leakage Current:** Less than 10 µA
- **Calibration:** Automatically calibrated for gain and offset. Calibration initiated at the GUI panel.
- **Excitation Off:** The excitation supply is programmed to 0 volts.

### 28124 Constant Current Excitation Supply
- **Type:** Balanced differential constant current excitation
- **Excitation:** 0 to 20.475 mA in 5 µA steps
- **Total Gage Voltage (Volts):** 22 – 1 x 700 minimum
- **Input Impedance:** 100 kΩ nominal per side
- **CMRR (DC to 1 kHz):**
  - 80 dB for 120 Ω gage
  - 70 dB for 350 Ω gage
  - 60 dB for 1 kΩ gage
- **Initial Accuracy:** 0.05%, 5 µA
- **Temperature Drift:** 30 nA + 0.0024% of setting per °C
- **Noise:** 65 pA/√Hz at 1 kHz
- **Bandwidth:** ±0.2 dB to 200 kHz (RGAGE < 1 kΩ)

### 28124 MUTE Mode
In harsh test environments, a sensor or input cable can become faulty or intermittent during a critical test. With high gain signal conditioning this can be troublesome if large signal swings on input or output cabling cross couple to other channels. The 28124 Mute control places the channel in the quietest operational state to minimize system noise in the event of a failed sensor. The Mute Mode is also useful to terminate unused channels in a safe and quiet state.

### 28124 Transducer Health Monitor
- **Sensor Excitation Monitor:** Transducer excitation voltage or current is monitored and reported to the user on-the-fly. Measured excitation is compared to factory set tolerance and GUI indicators report if out of tolerance.
- **Sensor Resistance Monitor:** Transducer resistance is monitored on-the-fly and compared to user defined limits. GUI indicators report if sensor resistance is out of user tolerance.
- **Sensor Open/Short Monitor:** Transducer open or short condition is monitored and reported to the user via GUI indicators.
- **Transducer Leakage Resistance Measurement:** The 28124 monitors gage bias levels in order to detect constant current excitation leakage conditions in the external current loop. Transducer leakage status is monitored and reported via the GUI.
- **Excitation Current Limit:** Current limit protection is provided by the 28124 excitation supply. Possible causes of current limit are an incorrect excitation setting or a shorted transducer. Current limit indicators are provided in the GUI.
- **Excitation Thermal Shutdown:** The excitation supply regulator die temperature is continuously monitored and will shut down should the temperature reach a level where damage to the excitation supply may occur. Thermal shutdown indicators are provided in the GUI.
**28124 Input Characteristics**

**Type:**
Balanced differential w/ programmable AC/DC input coupling

**Input Impedance:**
10 MΩ //100 pF per side

**Max Level (AC + DC + Common Mode):**
±10 Vpk for f ≤ 200 kHz
±10 Vpk x (200 kHz/f) for f > 200 kHz

**Input Protection (Power On):**
30 V continuous, 100 Vpk for 1mS, 10% duty cycle

**Offset Drift:**
1 µV/°C, typical

**Noise:**
7 nV/√Hz at 1 kHz and pre-filter gain > 64, typical

**AC Coupling Frequency:**
0.25 Hz (3.01 dB)

**CMRR (DC Coupled):**
110 dB, DC to 440 Hz and input gain > x16

**CMRR (AC Coupled):**
100 dB, 10 Hz to 440 Hz

**Auto Bridge Balance Mode:**
The bridge is automatically balanced utilizing voltage insertion at the input amplifier when bridge balance mode is selected. The inserted voltage is derived from and thus tracks the excitation supply. A successive approximation A/D converter mechanization is used for rapid bridge balance.

**Range:**
Bridge balance algorithm selects the most appropriate range to achieve balance with finest resolution.

**32 mV/V Mode Auto-Balance Ranges:**
±0.001 mV/V to ±32 mV/V in ±0.976 µV/V steps

**512 mV/V Mode Auto-Balance Ranges**
(Gain limited to x512):
±0.016 mV/V to ±512 mV/V in ±15.625 µV/V steps

**Accuracy:**
±0.1% of setting ±0.1% of F.S. range

**Stability:**
±25 ppm / °C of setting

**Drift (RTI):**
±0.3 µV / °C for 32 mV/V range;
±5 µV / °C for 512 mV/V range

**Auto Balance Time:**
Less than 60 seconds per system of 64 channels.

---

**Auto Suppress Mode:**
A programmable DC offset derived from a precision 10 V reference is injected at the channel input stage to suppress the gage DC operating voltage. Manual or automatic suppression modes are supported.

**640 mV Suppress Ranges:**
±0.001 mV to ±640 mV in ±19.53 µV steps

**10.24 V Suppress Ranges**
(Gain limited to x512):
±0.3125 mV to ±10.24 V in ±312.5 µV steps

**Accuracy:**
±0.1% of setting ±0.1% of F.S. range

**Stability:**
±25 ppm / °C of setting

**Drift (RTI):**
±0.3 µV / °C for 640 mV range; ±5 µV / °C for 10.24 V range

**Auto Suppress Time:**
Less than 60 seconds per system of 64 channels.

---

**28124 Amplifier Characteristics**

**Pre-Filter Gain:**
x1 to x512 in binary steps with overload detection (10.5 Vpk threshold)

**Post-Filter Gain:**
x1/16 to x16 in binary steps with vernier adjustment

**Overall Gain:**
x1/16 to x8192

**Gain Setability:**
0.0125% steps for POG ≥0.5X
0.0125%/POG for POG <0.5X

**DC Gain Accuracy:**
0.01% typical, 0.1% maximum for POG ≥0.5X
0.1%/POG maximum for POG <0.5X

**Gain Ratio of Wideband (Unfiltered) to the Filtered Outputs:**
Each of the three 28124 outputs may be selected for wideband or filtered operation under program control. The ratio of the gain on the wideband output to the filtered output may be set from 0.1000 and 1.0000 with 0.1% resolution. All GUI gain wizard calculations will be based on filtered output.

**Stability:**
±0.02% for 6 months
Temp Coef.: ±0.004%/°C

**DC Linearity:**
±0.005%/± FS for wideband operation

**Frequency Response:**
DC to 100 kHz, 0 dB ±0.1 dB
–3 dB typical @ 250 kHz

---

**High Frequency Rolloff:**
18 dB/octave

---

**28124 Test Modes**

**Amplifier Short:** A switch at the amplifier input is utilized to ground the input stage for measurement of noise and DC offset.

**Test Bus:** Test input allows for injection of a test signal. An external test signal or the 28000-?-TEST Test Subsystem may be connected at the rear panel. Refer to the 28000-?-TEST Test Subsystem specification for more information.

**10VDC CAL:** A calibrated 10 VDC reference is connected to the amplifier input. The NIST traceable measured error (in percent) is stored in non-volatile memory on the card. Subsequent NIST traceable field measurement of the 10VDC reference requires the 28000-4A-TEST test subsystem.

**DC Shunt Cal:** Applies shunt to bridge.

**Excitation Monitor (Constant Voltage Mode Only):** The amplifier input is switched from the bridge to the excitation supply to monitor the excitation voltage at the amplifier output. Excitation monitor gain is x0.5.

**Excitation Off:** The excitation supply is programmed to zero volts or zero mA.

**AC Shunt Calibration (Constant Voltage Mode Only):** An AC shunt calibration current is injected into the bridge to verify bridge impedance and to evaluate the end-to-end frequency response of the system. The AC shunt reference signal is derived from the voltage on the test bus.

**AC Shunt Sensitivity:**
10 µApk per Vpk of test bus voltage

**AC Shunt Current Accuracy (350 Ohm Bridge):**
±0.2% at 1 kHz
–5% typical at 50 kHz
–3 dB typical at 160 kHz

**AC Current (Constant Current Mode Only):** An AC current is injected into the current loop to evaluate end-to-end system frequency response. The AC current is generated from a voltage waveform on the test bus.

**AC Current Sensitivity:**
100 µApk per Vpk of test bus voltage

**AC Shunt Current Accuracy (350 Ohm Loop Resistance at Input):**
±0.2% at 1 kHz
–5% typical at 50 kHz
–3 dB typical at 160 kHz
28124 Details and Specifications

28124 Filter Type Characteristics

Flat/Pulse Low-Pass Filters

Our LP4FP 4-pole flat/pulse low-pass filters provide the user with the versatility to address applications in either the time or frequency domain.

Flat Mode Low-Pass Filters

Precision LP4F “flat” mode characteristics are specified to have outstanding passband flatness equivalent to the Butterworth yet deliver very sharp roll-off characteristics.

The LP4F is a good choice as an anti-aliasing filter and for applications such as spectral analysis. The LP4F has zero passband ripple and roll-off superior to the Butterworth.

Pulse Mode Low-Pass Filters

For the time domain, we offer the LP4P “pulse” mode low-pass filters. These filters have excellent transient response and phase linearity making them ideal filters for time domain applications including transient (shock) measurements and time domain waveform analysis … all with roll-off characteristics superior to their Bessel filter counterparts.

LP4FP Specifications:

- 4-pole, 4-zero low-pass filter.
- Programmable for maximally flat pass-band (LP4F) or linear phase with optimized pulse response (LP4P).

Note: Other filter types and cutoff ranges available upon request. Please consult factory.

Cutoff Frequencies:

Flat Mode:
- 2 Hz to 2.046 kHz in 2 Hz steps
- 2.2 kHz to 100 kHz in 200 Hz steps

Pulse Mode:
- 1 Hz to 1.023 kHz in 1 Hz steps
- 1.1 kHz to 100 kHz in 100 Hz steps

Amplitude Accuracy:
- ±0.1 dB max, DC to 0.8 Fc
- ±0.2 dB max, 0.8 Fc to Fc

Amplitude Match:
- ±0.1 dB max, DC to 0.8 Fc
- ±0.2 dB max, 0.8 Fc to Fc

Phase Match:
- ±1° max, DC to 0.8 Fc
- ±2° max, 0.8 Fc to Fc

Bypass:
- Bypasses filter but not amplifier stages.

Bypass Bandwidth:
- 250 kHz, typical
Output Characteristics

Primary (Rear Panel) Output: Output available at rear panel of chassis via 50-pin D connector (M3 chassis) or 26-pin high-density D connector (M5 chassis). For M3 chassis, one 50-pin D accommodates up to 16 primary outputs for four 28124 cards. For chassis with the M5 option, one high-density 26-pin D is available per card slot.

Auxiliary Outputs: Two female 15-pin D connectors available on the front panel of the 28124 card.

Type:
DC coupled, single-ended output with selectable ground sense

Output Ground Sense:
Used for driving grounded single-ended loads. Output is referred to ground at the load. Output sense also reduces ground loop interference by breaking the connection between the load ground and the 28124 channel ground.

Impedance:
Hi Output: 10 Ω // 100 pF
Low Output (Sense Input): 100 Ω // 100 pF or ground via manual card switch.

Output Shield:
Chassis ground

Max Output:
±10 Vpk, ±25 mA pk

Offset:
<5 mV after auto-adjust at any gain setting

Offset Drift:
1 µV/°C, RTI + 150 µV / °C RTO

Noise:
2.8 µV rms RTI + 60 µV rms RTO,
3 Hz to 100 kHz

Crosstalk:
–90 dB, DC to 100 kHz

Output Monitor:
A switch at the output of each channel allows for multiplexed connection to the 28000 chassis output monitor bus BNC connector for viewing the channel output with an external device.

28124 General Characteristics

28124 Card Size:
6.63 x 17.5 x 0.75 inches

Card Weight:
1.4 lb. net

Temperature:
0 °C to 40 °C (operating);
–20 °C to 70 °C (storage)

Connectors:
The input connectors are integral to the 28124 card. Cutouts on the 28000 frames allow the input connector to pass through the backplane and to directly mate with the input cables.

Two 26-pin high-density D connectors are utilized for the 4 inputs (2 inputs per connector). Connectors have high quality machined gold plated pins/sockets.

28124 output connectors are integral to the 28000 System chassis. Three wires per output are provided to accommodate twisted/shielded cables. Two additional auxiliary outputs with ground sense capability are available via 15-pin DB connectors the front panel.
28124 Accessories and Ordering

**Accessories**

**Mating Connectors**

Precision Filters mating connectors accommodate up to 22-AWG wire and are supplied with high quality metal backshells and gold plated screw machined contacts for high reliability connections and long service life.

**CONN-IN-26D-MTL:** High-Density 26-pin D-shell mating input connector with machined crimp pins and metal backshell with strain relief.

**CONN-IN-26D-SC-MTL:** High-Density 26-pin D-shell mating input connector with machined solder cup pins and metal backshell with strain relief.

**CONN-OUT-26D-MTL:** High-Density 26-pin D-shell mating output connector with machined crimp pins and metal backshell with strain relief.

**CONN-OUT-26D-SC-MTL:** High-Density 26-pin D-shell mating output connector with solder cup pins and backshell with strain relief.

**CONN-OUT-15D:** 15-pin D-shell mating output connector with machined crimp pins and metal backshell with strain relief.

**CONN-OUT-15D-SC:** 15-pin D-shell mating output connector with machined solder cup pins and metal backshell with strain relief.

**CONN-OUT-50D:** 50-pin D-shell mating output connector with crimp pins and backshell with strain relief.

**CONN-OUT-50D-SC:** 50-pin D-shell mating connector with solder cup pins and backshell with strain relief.

---

**Ordering Information**

28124-<LP4FP>

Filter Specification:

4-pole low-pass (LP4FP)

**BC6, BC7, BC8, BC9 Programmable Bridge Configuration Module:**

One module is required per 28124 card to support bridge completion or DC shunt cal options.

---

**Precision Product Solutions**

For over 30 years Precision Filters has been a global provider of instrumentation for test measurements. You can rely on a single source for signal conditioning and switching—a complete range of instrumentation—products optimized to work together to provide high performance at reasonable cost.

**Precision Products**

**Precision PF-1U-FA Multi-Channel Programmable Filter/Amplifier System**

*Exceptional desktop performance at low cost.*

Ideal for conditioning low-level voltage inputs in front of high-resolution digital data acquisition systems. Fully programmable 8-channel and 16-channel configurations are available, both offering a choice of either 4- or 8-pole low-pass filters with programmable gain.

**464kB High Density Programmable Switch Matrix**

*Computer controlled analog signal switching replaces tedious manual patch panels.*

The 464kB is a reliable solid-state switch matrix system that provides computer-controlled connection between 256 inputs and 256 outputs, all in a single mainframe. Save time and reduce errors on test system setup. Download switch configurations from the host computer over the network. Built-in self-test with fault diagnostics.
